CRISPR application predictor

Emilia Grzesiak
DSSI Summer 2020
Mentor: Nisha Mulakken (Bioinformatics)
Motivation

• CRISPR, a genome editing tool, has become increasingly popular and cost-effective
  • Not everyone will use this technology ethically, some may use it nefariously
• Can we identify who bioengineered DNA and what their goals were?
  • Proactive project
Approach

- Bioengineers make small design choices that add up as their “DNA signature”, but impossible to notice with human eye
- Database: Addgene (popular service that delivers plasmids for research purposes)
- Used 1-D Convolutional Neural Network to classify depositor per plasmid
- Model based off published journal paper [1]

Results & Conclusion

- Achieved validation and cross validation accuracy of 66%
  - Had 66,000+ plasmids and 1,400 depositors
- Original paper achieved 48% validation and cross validation accuracy
  - Had 36,764 sequences and 827 depositors
- Next steps:
  - Evaluate performance of RNN models
  - Scan sequences to determine “DNA signature” of depositor
